

# B2B Pricing Execution Maturity Assessment

## Pricing Execution Maturity Matrix

A focused module of the Configure to WIN Quote Performance Scan. Use this matrix to discuss six pricing execution dimensions from Reactive through Intelligent. The levels describe process practice; they are not an industry benchmark or a requirement that every organisation must reach Intelligent.

| Six dimensions                                                                                                                                                                                                              | Response scale                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Pricing data foundation<br>2. Customer-specific and contracted pricing<br>3. Calculations and deal economics<br>4. Price execution<br>5. Exception and approval governance<br>6. Traceability and performance visibility | 0 - Ad hoc or manual<br>1 - Partly defined<br>2 - Documented but inconsistent<br>3 - System-supported and governed<br>4 - Measured and continuously improved |

The workbook calculates a separate average and maturity level for each completed dimension. It never sums or averages the six dimensions and does not calculate an overall Pricing Maturity Score or Quote Performance Score.

## Pricing data foundation

| Level                                                                                                                                              | Process practice                                                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reactive                                                                                                                                           | List, cost, floor and currency values are gathered manually from scattered sources. The correct source and version depend on individual knowledge.          |
| Emerging                                                                                                                                           | Some sources and owners are identified, but teams still use local copies, incomplete records or manual version checks.                                      |
| Established                                                                                                                                        | Source definitions and update responsibilities are documented and repeatable, but effective dates, freshness or quote-time enforcement remain inconsistent. |
| Advanced                                                                                                                                           | Governed sources are resolved systematically with ownership, effective dates, currency treatment and traceable selected values.                             |
| Intelligent                                                                                                                                        | Source freshness, usage and failures are measured; drift and stale records are reviewed and controls are improved using evidence.                           |
| Example evidence: Controlled price-source register; source ownership; effective-date history; currency rule; freshness report; sample quote trace. |                                                                                                                                                             |

## Customer-specific and contracted pricing

| Level                                                                                                                                    | Process practice                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reactive                                                                                                                                 | Agreements are stored in emails, spreadsheets or previous quotes and must be found and interpreted manually.                                          |
| Emerging                                                                                                                                 | Selected agreements are recorded, but coverage, scope, effective dates or use in quoting remain incomplete or locally managed.                        |
| Established                                                                                                                              | Agreement records, scope and validity are documented and used repeatably, but application and deviation control are not consistently enforced.        |
| Advanced                                                                                                                                 | The applicable account- and product-specific price is resolved in the quote context; deviations and overrides are calculated, governed and traceable. |
| Intelligent                                                                                                                              | Agreement quality, expiry, deviation and override patterns are reviewed and used to improve maintenance and execution controls.                       |
| Example evidence: Contracted-price record; account/product scope; effective dates; approval source; deviation calculation; override log. |                                                                                                                                                       |

## Calculations and deal economics

| Level                                                                                                                          | Process practice                                                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Reactive                                                                                                                       | Discounts, margins, rebates and incentives are calculated in person-owned spreadsheets or with inconsistent definitions.                       |
| Emerging                                                                                                                       | Shared templates or common formulas exist for some quotes, but manual exceptions and competing definitions remain.                             |
| Established                                                                                                                    | Calculation definitions are documented and repeatable, but they are not enforced consistently across teams, quote types or systems.            |
| Advanced                                                                                                                       | Governed formulas use traceable inputs to calculate discounts, margins, rebates, incentives and other deal measures systematically.            |
| Intelligent                                                                                                                    | Calculation outcomes, exceptions and formula performance are reconciled and reviewed; definitions are refined through a managed feedback loop. |
| Example evidence: Calculation specification; formula version; source mapping; reconciliation report; sample calculation trace. |                                                                                                                                                |

## Price execution

| Level                                                                                                                | Process practice                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Reactive                                                                                                             | The applied price is selected or overridden manually, with limited visibility into why it was used.                             |
| Emerging                                                                                                             | Pricing guidance exists, but adoption is local and manual overrides are not recorded consistently.                              |
| Established                                                                                                          | Standard price-selection and override practices are documented and repeatable, but enforcement differs by team or workflow.     |
| Advanced                                                                                                             | The applicable price is applied systematically; overrides require defined context and remain visible, controlled and traceable. |
| Intelligent                                                                                                          | Execution accuracy, override patterns and leakage are measured and used to refine price-selection and exception controls.       |
| Example evidence: Quote sample; price-resolution trace; override log; reason codes; release check; exception report. |                                                                                                                                 |

## Exception and approval governance

| Level                                                                                                                         | Process practice                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Reactive                                                                                                                      | Approval depends on judgement, email and individual availability; triggers and authority are unclear.                               |
| Emerging                                                                                                                      | Some thresholds and roles are defined, but routing and application vary by team, deal or reviewer.                                  |
| Established                                                                                                                   | Approval policy, authority and routing are documented and repeatable, but enforcement, evidence or reapproval remains inconsistent. |
| Advanced                                                                                                                      | Governed rules apply authority, routing and reapproval systematically and preserve the decision context and outcome.                |
| Intelligent                                                                                                                   | Approval outcomes, timing, false positives, exceptions and rule drift are measured and used to refine controlled routing.           |
| Example evidence: Approval policy; approval matrix; rule version; authority record; workflow log; rationale; reapproval test. |                                                                                                                                     |

## CONFIGURE TO WIN | PRICING EXECUTION MATURITY MATRIX

### Traceability and performance visibility

| Level                                                                                                                             | Process practice                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reactive</b>                                                                                                                   | Source values, calculations, rules and decisions cannot be reconstructed reliably; reporting is manual and retrospective.                 |
| <b>Emerging</b>                                                                                                                   | Some evidence is retained, but source, calculation, approval and reporting records remain fragmented.                                     |
| <b>Established</b>                                                                                                                | Required evidence and reporting definitions are documented and repeatable, but traces or management views are incomplete.                 |
| <b>Advanced</b>                                                                                                                   | A connected decision trace links inputs, calculations, rules and approvals, while recurring pricing exceptions are visible to management. |
| <b>Intelligent</b>                                                                                                                | Exception, leakage and control-gap trends are monitored; completed improvements and emerging drift are reviewed using evidence.           |
| <b>Example evidence:</b> Decision trace; exception report; dashboard definition; audit sample; leakage analysis; improvement log. |                                                                                                                                           |
